

Transit Gateways

Transit gateways are network transit hubs that enable you to connect multiple virtual private clouds (VPCs) and on-premises networks in a centralized manner within a cloud computing environment, such as Amazon Web Services (AWS).

Instead of establishing individual connections between every VPC and on-premises network, you can use a transit gateway to simplify network architecture and management. Transit gateways act as a central point for routing traffic between VPCs and external networks, providing better scalability, easier management, and improved traffic inspection and control. They help streamline network connectivity and reduce the complexity associated with managing multiple connections.

Use cases of Transit Gateways:

Transit gateways are used in various scenarios to simplify network architecture and enhance connectivity within cloud environments. Some common use cases include:

1. **Hub-and-Spoke Architecture:** Transit gateways are often deployed in a hub-and-spoke architecture where the transit gateway acts as a central hub connecting multiple VPCs (spokes) to each other and to on-premises networks. This architecture simplifies network management by reducing the number of connections required and centralizing traffic routing.
2. **Centralized Internet Access:** Transit gateways can be used to centralize internet access for multiple VPCs. Instead of each VPC having its own internet gateway, traffic from multiple VPCs can be routed through a transit gateway to a shared internet gateway or network address translation (NAT) instance, reducing the need for redundant resources and improving security posture.
3. **Cross-Region Connectivity:** Transit gateways enable connectivity between VPCs in different AWS regions, allowing organizations to build multi-region architectures for disaster recovery, data replication, and global load balancing. By using transit gateways, inter-region communication can be managed centrally and efficiently.
4. **VPN Connectivity:** Transit gateways support VPN connections, allowing on-premises networks to securely connect to multiple VPCs over encrypted tunnels. This facilitates hybrid cloud deployments, enabling organizations to extend their existing networks into the cloud while maintaining security and compliance requirements.
5. **Integration with Transit VPCs:** Transit gateways can be integrated with Transit VPC architectures, which involve using a dedicated VPC to consolidate and manage VPN connections between on-premises networks and multiple VPCs. Transit gateways simplify the implementation and management of Transit VPCs by providing a centralized routing hub.
6. **Traffic Inspection and Control:** Transit gateways allow for centralized traffic inspection and control through the use of network security features such as network access control lists (ACLs), security groups, and third-party security appliances. This enhances

visibility and security posture by providing a single point for monitoring and enforcing network policies.

Overall, transit gateways offer a scalable and efficient solution for connecting and managing network traffic within complex cloud environments, providing organizations with greater flexibility, reliability, and control over their network infrastructure.

Benefit of Transit Gateways over Peering connection:

Transit gateways offer several benefits over peering connections:

1. **Centralized Management:** Transit gateways provide a centralized hub for managing connectivity between multiple VPCs and on-premises networks. This simplifies network management tasks such as routing configuration, monitoring, and troubleshooting, compared to managing individual peering connections between every pair of VPCs.
2. **Scalability:** Transit gateways are highly scalable and can handle a large number of VPC attachments, allowing organizations to easily add or remove VPCs as their infrastructure grows or changes. In contrast, managing a large number of peering connections can become complex and cumbersome, especially in environments with numerous VPCs.
3. **Transitive Routing:** Transit gateways support transitive routing, meaning traffic can be forwarded between VPCs that are attached to the same transit gateway without the need for additional peering connections. This simplifies network architectures and avoids the need for complex routing configurations to enable communication between VPCs.
4. **Global Reach:** Transit gateways can span multiple AWS regions, enabling connectivity between VPCs in different regions without the need for region-specific peering connections. This is particularly useful for organizations with multi-region deployments, as it provides a centralized solution for inter-region communication.
5. **Integration with VPN Connections:** Transit gateways seamlessly integrate with VPN connections, allowing organizations to establish secure connections between on-premises networks and multiple VPCs using standard VPN protocols. This simplifies hybrid cloud deployments and provides a unified solution for both intra-VPC and inter-VPC connectivity.
6. **Support for Network Security Features:** Transit gateways support network security features such as network ACLs and security groups, allowing organizations to enforce security policies at the transit gateway level. This enhances security posture by providing a centralized point for traffic inspection and control.

Overall, transit gateways offer a more scalable, centralized, and feature-rich solution for managing network connectivity within cloud environments compared to peering connections. They streamline network management tasks, improve scalability, and enhance security and flexibility, making them a preferred choice for many organizations deploying complex cloud architectures.

In this setup, you're configuring networking components in AWS to establish connectivity between multiple Virtual Private Clouds (VPCs) using a Transit Gateway. The end goal is to enable communication between instances in different VPCs while ensuring network isolation and security. This setup facilitates efficient and scalable network architecture in AWS, allowing for centralized management and streamlined connectivity between VPCs.

😊 To begin with the Lab:

😊 Step 1: Create VPC

1. Login to AWS Console. Then navigate to VPC.
2. There you have to create a VPC with CIDR block 192.168.0.0/16, there is no specific need to create with same CIDR block you can choose one your choice. Keep it to one availability zone only.
3. Then we really don't need a public subnet just keep one private subnet. There is no requirement of NAT gateways and VPC endpoints. Just create your VPC.

Name tag auto-generation [Info](#)

Enter a value for the Name tag. This value will be used to auto-generate Name tags for all resources in the VPC.

Auto-generate

demo-transit-vpc

IPv4 CIDR block [Info](#)

Determine the starting IP and the size of your VPC using CIDR notation.

192.168.0.0/16

65,536 IPs

CIDR block size must be between /16 and /28.

IPv6 CIDR block [Info](#)

- No IPv6 CIDR block
- Amazon-provided IPv6 CIDR block

Tenancy [Info](#)

Default

Number of Availability Zones (AZs) [Info](#)

Choose the number of AZs in which to provision subnets. We recommend at least two AZs for high availability.

1 2 3

► Customize AZs

Number of public subnets [Info](#)

The number of public subnets to add to your VPC. Use public subnets for web applications that need to be publicly accessible over the internet.

0 1

Number of private subnets [Info](#)

The number of private subnets to add to your VPC. Use private subnets to secure backend resources that don't need public access.

0 1 2

► Customize subnets CIDR blocks

4. In less than a minute your VPC will be ready for use.

Create VPC workflow

Success

▼ Details

- Create VPC: [vpc-05205fb085af28c81](#)
- Enable DNS hostnames
- Enable DNS resolution
- Verifying VPC creation: [vpc-05205fb085af28c81](#)
- Create subnet: [subnet-0d563ed2e125addc6](#)
- Create route table: [rtb-075ab1472791bd837](#)
- Associate route table
- Verifying route table creation

[View VPC](#)

Step 2: Create Transit Gateway and Launch EC2 instances

1. Now from the left pane scroll it down and navigate to Transit gateways. There you need to click on create transit gateway.
2. Then you just need to give it a name and directly create a Transit gateway.

Create transit gateway Info

A transit gateway (TGW) is a network transit hub that interconnects attachments (VPCs and VPNs) within the same AWS account or across AWS accounts.

Details - optional

Name tag

Creates a tag with the key set to Name and the value set to the specified string.

Description Info

Set the description of your transit gateway to help you identify it in the future.

3. It generally takes some minutes for the transit gateway to be available.

You successfully created tgw-0fb9d9b4cf7861d6d / demo-TG.

You can visualize and monitor your Transit Gateway(s) from the [AWS Network Manager](#). Register your Transit Gateway by creating a [global network](#) to get started.

Transit gateways (1) <small>Info</small>		<small>Create transit gateway</small>
<input type="checkbox"/> Name	<input type="checkbox"/> Transit gateway ID	<input type="checkbox"/> State
<input type="checkbox"/> demo-TG	tgw-0fb9d9b4cf7861d6d	<input type="checkbox"/> Pending

4. Once it is available then you are going to attach VPCs to your transit gateway. Currently your will be having two VPCs, first one is your default VPC and other is the one that you just created.
5. Now you have to navigate to Transit gateway attachment. There click on create attachment.
6. There you will be creating two attachments for both of the VPCs.
7. First you will be creating attachment for default VPC.
8. Similarly, you have to create attachment for other VPC.

Details

Name tag - optional

Creates a tag with the key set to Name and the value set to the specified string.

Transit gateway ID Info

Attachment type Info

VPC attachment

Select and configure your VPC attachment.

DNS support [Info](#)

IPv6 support [Info](#)

Appliance Mode support [Info](#)

VPC ID

Select the VPC to attach to the transit gateway.

vpc-00e852ef26c39581b

Subnet IDs [Info](#)

Select the subnets in which to create the transit gateway VPC attachment.

ap-south-1a subnet-01c162e279b989d09 ▾

ap-south-1b subnet-05b1afa053579e078 ▾

ap-south-1c subnet-090908b5b996470fc ▾

subnet-01c162e279b989d09 X

subnet-05b1afa053579e078 X

subnet-090908b5b996470fc X

- Once they are created, now you have to navigate to EC2 and create 2 instances. One should be in default VPC and other should be in the new VPC.

Transit gateway attachments (2) Info						
<input type="checkbox"/> Name ↗		Transit gateway attachment ID	Transit gateway ID	State	Resource type	Resource ID
<input type="checkbox"/>	demo-attachment-01	tgw-attach-0ed3e9fc7a06caf6	tgw-0fb9d9b4cf7861d6d	Available	VPC	vpc-00e852ef26c39581b
<input type="checkbox"/>	demo-attachment-02	tgw-attach-0fe84ce586cc387ab	tgw-0fb9d9b4cf7861d6d	Available	VPC	vpc-05205fb085af28c81

- While launching your instance in your new VPC disable auto assign public IP.

Create new subnet

Auto-assign public IP [Info](#)

Disable

- Once both of the instances are up and running.

Instances (2) Info		C	Connect	Instance state	Actions	Launch instances	▼
<input type="text"/> Find Instance by attribute or tag (case-sensitive)				Any state	< 1 > @		
<input type="checkbox"/>	Name Info	Instance ID	Instance state	Instance type	Status check	Alarm status	Availability Z
<input type="checkbox"/>	demo-vpc-02	i-0e541f8bb58fcaa53	Running Q Q	t2.micro	Initializing I	View alarms +	ap-south-1a
<input type="checkbox"/>	demo-vpc-01	i-050643be9eb7ba5f1	Running Q Q	t2.micro	Initializing I	View alarms +	ap-south-1a

12. So, what we'll be doing from the demo-vpc-01 we will test the connectivity towards the demo-vpc-02 through ping.

13. So, if you want to test the ping connectivity, the security group of the demo-vpc-02 should allow the ICMP traffic as well. But for this demo to make things simple just allow all traffic from your default VPC. So, add the IP of your default VPC in source.

Inbound rules Info							
Security group rule ID	Type Info	Protocol Info	Port range	Source Info	Description - optional Info		
sgr-06d4d804efd6c139b	All traffic	All	All	Custom	<input type="text"/> 0.0.0.0/0 X	Delete	Info
sgr-0f40079f9328bb9a1	SSH	TCP	22	Custom	<input type="text"/> 172.31.0.0/16 X	Delete	Info
					<input type="text"/> 172.31.0.0/16 X		

14. Once this is all done now you have to go back to VPC and navigate to Transit gateway route table. There you have to select your route table and then go to routes.

15. There you have to ensure that two route entries should be present.

Transit gateway route tables (1/1) Info						C	Actions	Create transit gateway route table
<input checked="" type="checkbox"/>	Name Info	Transit gateway route table ID	Transit gateway ID	State	Default association route table	< 1 > @		
<input checked="" type="checkbox"/>	tgw-rtb-0e9bb7ee44d968b6c	tgw-0fb9d9b4cf7861d6d	Available I	Yes				

Transit gateway route tables: tgw-rtb-0e9bb7ee44d968b6c								
Exact CIDR Select a valid IP4 or IPv6 CIDR. <input type="text"/> 0.0.0.0/0, ::/0	Longest prefix match Enter a valid IP4 or IPv6 and press enter. <input type="text"/> 0.0.0.0, ::	Supernet of match Select a valid IP4 or IPv6 CIDR. <input type="text"/> 0.0.0.0/0, ::/0	Subnet of match Select a valid IP4 or IPv6 CIDR. <input type="text"/> 0.0.0.0/0, ::/0 X	<input type="text"/> ::/0 X	=	@	X	

Routes (2) Info						C	Actions	Create static route
<input type="checkbox"/>	CIDR	Attachment ID	Resource ID	Resource type	Route type	Route state	< 1 > @	
<input type="checkbox"/>	172.31.0.0/16	tgw-attach-0ed3e9fc7a06caf6	vpc-00e852ef26c39581b	VPC	Propagated	Active I		
<input type="checkbox"/>	192.168.0.0/16	tgw-attach-0fe84ce586cc387ab	vpc-05205fb085af28c81	VPC	Propagated	Active I		

16. Now you have to connect with your demo-vpc-01 instance and once it is connected try to ping the other instance.

17. There you will see that things are not working at this stage not because of the transit gateways but because of the VPC route table.

```

      #
~\_ ##_
~~ \_#####
~~ \###|
~~ \#/ __ Amazon Linux 2023
~~ V~' '-'> https://aws.amazon.com/linux/amazon-linux-2023
~~ / /
~~ . / /
~~ / / /
/m/'

[ec2-user@ip-172-31-39-60 ~]$ ping 192.168.142.174
PING 192.168.142.174 (192.168.142.174) 56(84) bytes of data.

```

18. Now you have to navigate to VPC and open route table of default VPC and in the routes you have to add the route for other VPC and the target is your transit gateway.

Destination	Target	Status	Propagated
172.31.0.0/16	local Q local	Active	No
Q 0.0.0.0/0	Internet Gateway Q igw-0dbb1d264233ccbaf	Active	No
Q 192.168.0.0/16	Transit Gateway Q tgw-0fb9d9b4cf7861d6d	-	No

[Add route](#)

19. Then you have to go to the route table your new VPC and add route for default VPC and the target is transit gateway.

Destination	Target	Status	Propagated
192.168.0.0/16	local Q local	Active	No
Q 172.31.0.0/16	Transit Gateway Q tgw-0fb9d9b4cf7861d6d	-	No

[Add route](#)

20. Once the setup is done you will see that things are working fine.

```
[ec2-user@ip-172-31-39-60 ~]$ ping 192.168.142.174
